

GEN Z FASHION MARKET RESEARCH

India & Global Opportunity Assessment

Prepared for a Gen-Z Streetwear & Lifestyle Brand Launch

Prepared by Metlink

September 2026

1. Executive Summary

Gen-Z fashion is a large, fast-growing, and structurally distinct category. Globally it is expanding at roughly 7.5% CAGR — well ahead of the broader apparel market's 3–4% — and India is already one of the largest single-country Gen-Z fashion markets in the world, not an emerging afterthought.

This report combines global market sizing (Fortune Business Insights, KBV Research, Statista, Wazir), India-specific consumption data (BCG × Snap, CareEdge, Bain, JLL), and current retail/runway signals (Flipkart, Myntra, EDITED, Depop, Vogue) to answer three questions for a Gen-Z streetwear brand launch: how big is the opportunity, how does the Indian Gen-Z consumer differ from the global template, and which product categories deserve the investment.

\$241.9B Global Gen-Z fashion market, 2026	\$18.56B India Gen-Z fashion market, 2025	377M India's Gen-Z population	7.47% Global Gen-Z fashion CAGR
--	---	---	---

Bottom line: the commercial evidence supports building the brand around a compact, recognizable silhouette system — oversized tops, relaxed/wide bottoms, strong graphics — rather than chasing every micro-trend. Denim and cargo bottoms deserve heavier investment than a T-shirt-led strategy would suggest, because they carry higher average order values and anchor a complete look.

2. Global & India Market Size

The global Gen-Z fashion market was valued at \$227.39B in 2025 and is forecast to reach \$241.88B in 2026, on its way to \$430.33B by 2034 (7.47% CAGR). A 2027 figure is not separately published; applying the reported CAGR gives a planning estimate of approximately \$259.95B.

Figure 1 — Global Gen-Z fashion market size, 2025–2034 (2027 is a CAGR-based estimate)

Crucially, Gen-Z fashion is growing faster than the apparel category it sits inside — both globally and in India — which is the core argument for a cohort-specific brand rather than a generic apparel label.

Figure 2 — CAGR comparison: Gen-Z fashion vs. total apparel, global and India

India in global context

India's Gen-Z fashion market was estimated at \$18.56B in 2025 — larger than Japan, Germany, and the UK, and second only to China in the countries reviewed. This positions India as a primary market for the brand, not a secondary expansion market.

Figure 3 — 2025 Gen-Z fashion market size by country (US\$ billions)

Using India's 2025 base and the reported Asia-Pacific Gen-Z growth rate (8.25%), a reasonable planning range for India's Gen-Z fashion TAM is \$19.7–20.1B in 2026 and \$20.9–21.8B in 2027. These are constructed planning estimates, not officially published country-level forecasts.

Figure 4 — India Gen-Z fashion TAM: conservative vs. trend-case planning scenarios

3. The India Gen-Z Consumer

India's Gen-Z population is approximately 377 million and is estimated to influence around 46% of India's total consumer spending. Within BCG's broader consumption framework, Gen-Z-driven fashion and lifestyle spending is estimated at roughly \$45–50B — a much larger number than the \$18.56B market-research figure, because it measures influenced spending rather than a narrowly defined fashion-market category. The two figures use different methodologies and should not be added together.

Online-first, insurgent D2C brands are disproportionately reliant on this cohort: Gen-Z shoppers represent around 40% of GMV for leading Indian online-first brands, compared with roughly 30% of overall e-retail GMV — a strong signal that Gen Z is the natural early audience for a new digital-native label. Myntra separately reports that Gen-Z shoppers purchase 30–40% more frequently than millennials.

Figure 5 — Gen-Z consumer behaviour signals (India/global research synthesis)

Price sensitivity and weak brand loyalty are the defining commercial traits of this cohort. McKinsey found Gen-Z consumers are 9 points less likely to care about brand if they like the style, and 10 points more likely to have switched to a cheaper alternative; only ~29% of a Gen-Z wardrobe comes from the same brand, versus 52% for shoppers aged 50+. The practical implication: competitive pressure comes from whatever looks best in the feed that day, not from a fixed set of incumbent labels — so product desirability and drop cadence matter more than brand heritage.

4. Five-Year Trend Evolution (2021–2027)

Tracking the dominant silhouette story year by year shows a consistent arc: from pandemic comfortwear, through the Y2K/low-rise explosion, into a sustained "anti-skinny" relaxed-fit era that has now become permanent retail infrastructure rather than a passing trend.

Gen-Z Fashion Trend Evolution, 2021-2027

Figure 6 — Dominant Gen-Z fashion themes, 2021-2027 (2027 is a forward signal, not an observed year)

Year	Dominant direction	Key products
2021	Post-lockdown comfort	Joggers, sweatpants, hoodies, loungewear
2022	Y2K explosion	Cargo pants, parachutes, baggy denim, baby tees
2023	Streetwear + big-bottom silhouette	Wide jeans, cargos, oversized tees, jerseys
2024	Anti-skinny / relaxed dominance	Baggy jeans, carpenter & parachute pants
2025	Gen-Z fundamentals	Baggy denim, co-ords, utility, sportswear
2026	Edited / intentional streetwear	Oversized, wide denim, utility, co-ords
2027E	Next evolution	Low-slung wide denim, dark denim, expressive graphics

5. Category Commercial Priority

No public dataset reports worldwide unit sales by garment for the Gen-Z cohort, so category priority here is built from retailer assortment data (Flipkart, Myntra), trend-velocity research (EDITED, Depop), and runway forecasting (Vogue, Denimology) rather than a single source of truth.

Category Commercial Priority — 2026 vs 2027 Outlook

Oversized Graphic Tees -	Very Strong	Very Strong
Baggy Jeans -	Very Strong	Very Strong
Wide-Leg Jeans -	Very Strong	Very Strong
Cargo Pants -	Very Strong	Very Strong
Oversized Shirts -	Strong	Very Strong
Co-ords -	Strong	Very Strong
Jerseys -	Strong	Very Strong
Hoodies -	Strong	Strong
Parachute Pants -	Strong	Strong
Jorts -	Strong	Strong
Racing Apparel -	Strong	Very Strong
Dark / Raw Denim -	Medium	Very Strong
Low-Rise Wide Denim -	Medium	Strong
Knit Polos -	Medium	Strong
	2026	2027

Figure 7 — Category priority, 2026 vs. 2027 outlook

Oversized graphic tees, baggy jeans, wide-leg jeans and cargo pants are the four categories with the strongest evidence in both years and should anchor the core range. Oversized shirts, co-ords, jerseys and racing-inspired pieces strengthen materially into 2027 and are the best candidates for expansion investment. Dark/raw denim and low-rise wide denim are currently medium priority but show the clearest upward inflection for 2027, driven by SS27 runway direction (Vogue, Denimology) and rising indigo-denim mentions (EDITED).

6. India Is Not Copying Global Gen-Z

Indian Gen-Z fashion is an adaptation of the global template, not a replica. Where the global Y2K revival centres on the baby-tee-plus-ultra-low-rise-jeans combination, Indian retail and social data consistently show the oversized-graphic-tee-plus-baggy/wide-denim pairing as the stronger local expression. Brand strategy should be built around this local formula rather than importing the Western silhouette wholesale.

This matters for assortment planning: baby tees, ultra-low-rise skinny jeans and tight-fitted pieces should remain a minority share of the India-facing range, even though they perform well in other markets.

7. Recommended Product Architecture

Rather than launching 150–200 SKUs across every trending silhouette, the evidence supports a focused first collection of roughly 40–60 core styles, weighted toward tees and bottoms, with a smaller experimental "drop" layer to capture emerging trends without diluting the core identity.

Recommended First-Collection Product Architecture

Figure 8 — Recommended allocation of first-collection product development effort

Category rationale

- T-shirts / graphic tees (45%): frequent, lower-ticket repeat purchases; the strongest and most consistent commercial signal in both Indian and global data.
- Denim, cargos & wide bottoms (22.5%): lower purchase frequency but materially higher average order value; the primary driver of a recognizable "complete look."
- Hoodies & sweatshirts (12.5%): core seasonal layering pieces, strong in cooler months and northern Indian markets.
- Shirts, jerseys & co-ords (12.5%): basket-building layer; co-ords in particular are called out repeatedly in Flipkart's Gen-Z trend data as a fast-growing India silhouette.
- Experimental drops (7.5%): Y2K, racing, utility and India-inspired graphic capsules used to test trends before they enter the core range.

8. Strategic Recommendations

- Build the brand identity around one repeatable system — oversized top, relaxed/wide bottom, strong graphic or utility detail, limited colour palette — rather than positioning as a marketplace-style seller of "every Gen-Z trend."
- Prioritise India as a primary market, not a secondary one: at \$18.56B in 2025, it already ranks above Japan, Germany and the UK in Gen-Z fashion market size.
- Weight the range toward denim and cargo bottoms earlier than a T-shirt-first roadmap would suggest, to capture higher AOV and stronger complete-look merchandising.

- Plan an 18–25 primary age target within the 377M India Gen-Z population, rather than designing for the full 15–29 span at once.
- Treat price and perceived value as the leading purchase driver — Gen-Z brand loyalty is measurably weaker than older cohorts, so desirability and drop cadence matter more than heritage or logo equity.
- Build a recurring drop calendar (Y2K → racing → utility → sports → vintage → India-inspired → experimental) to sustain engagement between core-range restocks.
- Increase investment in dark/raw denim, low-slung wide denim, and knit polos through 2027 — the categories with the clearest positive inflection in current runway and retail signals.
- Keep nightwear and formal tailoring as secondary lines; the evidence does not support giving them launch-level inventory budget.

9. Sources & Methodology Notes

Figures in this report are drawn from: Fortune Business Insights and KBV Research (global and APAC Gen-Z fashion market sizing); Statista and Wazir Advisors (global and India apparel market sizing); BCG × Snap and CareEdge (India Gen-Z population and spending); Bain and JLL (India online retail and Gen-Z retail share); EDITED, Depop Newsroom, Vogue, Denimology and Cosmopolitan (trend velocity and runway signal); and Flipkart, Myntra and Indian fashion press (India-specific category and silhouette data).

Where sources disagreed on methodology or absolute market size — for example, Fortune's \$227.4B 2025 global estimate versus a competing 2026 estimate of \$236.4B from another provider — this report uses ranges and flags calculated/estimated figures explicitly, rather than presenting a single number as more precise than the underlying research supports. There is no reliable public dataset reporting exact global unit sales by garment category for the Gen-Z cohort specifically; category priority is therefore a synthesis of retail assortment data, trend-velocity research and runway forecasting rather than a measured statistic.
